

hensive and web-based tool that supports a high level of communication. It also enables effective association among various stakeholders such as business developers, and analysts to drive an effective global application testing process.

3. **Trac:** It is not an exact bug testing tool but is the most effective and best manual testing tool available. Once the user integrates Trac with the SCM system, it allows the user to browse, view the history, the changes made, and more.
4. **QTP:** It provides functional and regression testing for the software as UFT software testing. It is used as a quality assurance tool that possesses a graphical interface.
5. **Load Runner:** It is developed by one of the best producers in the market called MicroFocus. Load Runner is majorly used to measure behaviour and performance.
6. **TestLink:** It is a user-friendly tool that supports various services such as test reports, test suites and cases, user management, and test plans. You can also generate reports and statistics with TestLink.
7. **Mantis:** Mantis is developed to support the new inventions in technology. It is a web-based tool that comes along with its mobile version.
8. **Fog-Buzz:** It uses a unique way to record, function, and assign the cases. Fog-Buzz makes it easy for the tester to track milestones and measure success efficiently.
9. **Selenium:** It is the most sought-after tool as it offers a number of benefits and is available free of cost. Selenium provides the tester with portable software testing as it makes it easy to work on the web-applications.
10. **Lamda Test:** It is recommended by many experienced testers as it is a cross-browser cloud checking tool. Lamda Test is a partially free tool and can be updated based on your unique set of requirements.

Black Box testing software:

Also known as Behavioral Testing, Black Box Testing allows the tester to test software without knowing its internal coding. This means that the test can be performed even if the internal data such as coding, server, development method, and logic is not known to the tester. The working of black-box testing enables us to identify how the system responds to various actions, usability issues, friendliness, reliability, and response time.

It is a powerful technique to test software from a user's perspective where it is tested against the external factors responsible for failures. Also, it tests
