

improve and simplify the testing process. EcEmma is used by the testers to perform wide range tests on their code.

3. **Google Test:** It is a C++ framework by Google that allows a list of substantial features such as death tests, discovery, fatal and non-fatal failures, value parameterised tests, XML test report generation, etc. It also supports various platforms like Mac OS, Win 32, Linux, and Windows.
4. **Cfix:** It is uniquely designed for NT Kernel mode and Win 32. Cfix is a framework for C/C++ codes and it makes the test process reasonably easy.
5. **NUnit:** It is an easy testing framework that does not require human intervention to judge the results. NUnit supports all .NET languages and is free of cost with no limitation.
6. **CppUnit:** It is a framework written in C++ that produces the test outputs either in XML or text formats.
7. **HTML Unit:** This testing tool is a GUI-less browser for Java programs that models HTML documents and allows them to invoke pages with the help of API.
8. **JUnit:** As the initial of its name says, it is an automation tool for Java that can easily integrate with IDEs like Macen Act and eclipse. JUnit is an open-source framework and is free of cost for any kind of Java Development.
9. **Veracode:** As it offers a set of powerful features along with supported languages such as .NET, Java, and C++, it comes with some investment.

Grey Box testing software

The process of testing a software application internally and externally is carried out with the combination of white box and black box testing. However, this approach has its pros and cons as it is carried out using partial knowledge of a software's internal working. Grey box testing was developed with a view to overcoming these issues. It has been given the name of Grey Box as it is semi-transparent in nature. It means that a tester can partially see the internal structure.

The grey box testing technique is unique as it gives the ability to test both sides of application namely, presentation layer and coding. It is primarily used for Integration testing and penetration testing. It is also suitable for GUI, functional testing, web-services, web-applications, etc.

Grey Box Testing helps in boosting the product quality as it enables combined inputs from the tester and developer. It also helps in reducing the overhead of a long process of functional and non-functional types of testing. In order to initiate the testing using the Grey Box approach, it is not necessary for the tester
