

to access the source code. A test can be designed based on the knowledge of the program behaviour such as algorithm, high-level and detailed description, internal states, and architecture. In order to carry out this test, there are various tools available in the market that are either free of cost, partially free or paid.

Let us have a look at some of the best tools.

Top ten Grey Box testing tools

1. **Rational Functional Tester:** It is a tool from IBM which is a one-stop solution for Grey Box Testing requirements. Though it is not an open-source tool, it supports a range of technologies such as iSeries and zSeries.
2. **Chrome DevTools:** It is a known fact that almost the majority of web traffic comes from Google. Hence, Chrome DevTools is beneficial for debugging and web authoring for better optimisation with Google Chrome.
3. **Selenium:** Selenium is an open-source platform that helps the tester with browser automation. You can help the system to learn common user action with the help of Selenium's IDE capture interface and can test it on browsers repeatedly.
4. **Appium:** It is a cross-platform that also supports mobile apps. Appium is very similar to Selenium with the exception of mobile support.
5. **Test Rail:** It is one of the most comprehensive and innovative test management tools available in the market. No matter whether you are using an agile method or traditional method, Test Rail supports both of them.
6. **Veracode:** Veracode is a unified platform that offers on-demand testing services that can be integrated with the software development cycle seamlessly. Hence, It allows the team to find and fix the flaws at the time of development itself. Veracode includes both - static analysis and dynamic analysis to scan a third-party software and open-source code.
7. **Postman:** It is a simple Chrome testing application developed to interact with HTTP APIs. Postman enables testers for testing inside-out of any application and provides organized documentation for better collaboration.
8. **Burp Suite:** Burp Suite provides complete analysis in a fast, accurate, and effective way with the help of automation of manual detection techniques.
9. **JUnit:** The one feature that makes JUnit different is that it creates test-elements for the existing Java Class and logic. It is an open-source framework that enables the tester to create and run repeatable tests.
10. **JUnit:** It enables testers to initiate grey testing for .NET programming language. NUnit provides static Assert classes and custom attributes that help the tester to complete the test efficiently.
