

ties. In many organisations, testers work as an integral part of the software development team from the initial stage itself.

Passion for learning – Constant learning is necessary on the job because you will have to keep acquiring new technical knowledge and skills in order to improve and become better on the job. You will have to push yourself continually, motivate and enhance your repertoire of skills and abilities. As you grow with experience, you will have to develop an understanding of the software development lifecycle such as the database modelling, code processes, design approach and others.

Passion is going to play a vital role in this since it will provide the fuel for your career growth and progress. To understand if you fit into this profile, you should give it a try with hands-on on specific projects. If you feel that you find a fit with your expectations and personality, you can move further ahead, or you can choose to switch to an alternate career option immediately.

Technical skills

Apart from these non-technical skills, the following technical skills are crucial as you advance into your career as a tester.

Image Source: EDX.org

Basic understanding of Database/ SQL – Data is a critical engine that drives application functionality. This data is stored within the MySQL, Oracle database on the back-end. Often as a tester, you will have to work on validating these data, which would require you to perform basic query operations.

Knowledge of Linux commands – Many web applications and services, databases, application servers are deployed on Linux OS. Therefore, software testers must have a basic understanding of handling the Linux commands to manage the different tasks with application management.

Test management skills – Test management is an integral part of the software testing process. Proper test management is necessary for software testing and tracking the test cases made by your test team.

Experience with a defect tracking tool – It is crucial to identify defects early on, and have a systematic process for managing and sharing the same with your entire team, whether managers, developers or other testers.
