

- **Synopsis of a test suite:** This part includes the entire test suite in a nutshell. The synopsis provides the basic structure on which the entire test suite is constructed. It might also include certain tests that will enhance the effectiveness of the test suite.
- **Design of a test suite:** The entire design of the test suite is elaborately portrayed in this section. It also provides suggestions to improve the quality and extensiveness of the tests in the test suite. This design is executed further only after the official analysis of the design is complete.
- **Official Analysis:** The summary and the design needs to be extensively analyzed before sending it further. This analysis is mostly done to ensure that all the standards and policies of the industry are followed. Any changes in the design are also discussed here, and necessary alterations are made before the execution of the design.
- **Necessary Requirements:** This part includes all the conditions to be maintained before and after the execution of the test suite for its successful completion.
- **Anticipated Outcome:** There are certain predefined results to define the success of a test suite. The results obtained by performing the test suite are matched with these predefined results. The lesser the deviation of the obtained results from the predefined results, the more successful the test suite is. The test suite is certified if the deviation is within acceptable limits.
- **Evaluation of risk:** All the risks related to the test suite need to be spotted and examined as these risks will reduce the success chances of the test suite. After identifying the risks, they should be eliminated or reduced for the test suite to show minimum deviation from the predefined results.
- **Test instances:** This part of the template consists of the tests to be performed on the system under test (SUT). The tests are defined based on the parameters of the system that need to be tested. All the tests of the test suite are elaborately stated in this section of the template. The environment in which each test needs to be performed is also mentioned in this part of the template.
- **Written documentation:** The test results, the recordings, the readings, and other necessary things need to be documented properly to maintain a proper record of everything related to the test suite.

Setting up a testing culture:

- **Clear clarity in bug reporting:** A wrong bug report can lead to the
