

- Try to restrict other sites or any user from hotlinking files or any pictures from your website.
- Try to host big-sized files or content from third-party services such as a Google Drive or Dropbox link.
- Try to eliminate unwanted white space and notes existing in your website.
- Try to mitigate or compress your CSS, JavaScript, and HTML.

Website load testing software

There are countless numbers of software available in the market that can give the desired result for website load testing. Here are some best open source load testing software for website and their features:

1. Apache Bench- AB

Apache Bench, popularly known as AB, is the most accessible load testing software benchmark among website testing servers. However, earlier, it used to come as a part of AB's HTTP server. Currently, it is available as stand-alone software.

2. JMeter

It is another prominent and popular load testing software.. It has a very dynamic and powerful testing capacity. JMeter is an excellent product from the Apache software foundation. It can also help determine whether a website is producing the correct output results or not.

3. Siege

Siege is also a good load testing software. It is similar to the AB software. Still, it has several other features such as multiple uses of URLs while load testing. Also, it is quite beneficial in enabling high throughput.

4. Locust

It is one of the most advanced website load testing software. It is a python-based testing tool. It has a real-time web UI for monitoring results. It can be processed in distributed mode, enabling you to run several services in a coordinated fashion.

However, many commercial service providers will also provide you with performance testing or load testing with suitable stats in various forms. It would be best for a giant firm or website owner to go with a service provider rather than purchasing a load testing software.
