

Why is Selenium WebDriver used?

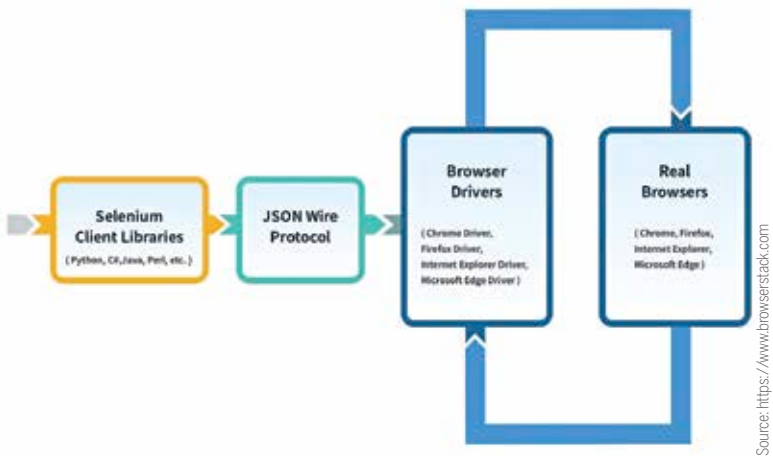

Selenium WebDriver is a fundamentally powerful web framework that allows you to perform cross-browser tests seamlessly. It helps in verifying whether web-based application automation testing is working well or not.

Selenium WebDriver helps you to use a preferred programming language for the creation of test scripts. Moreover, Selenium WebDriver is not good at managing window elements. However, this downside can be resolved by utilizing devices such as Auto IT, Sikuli, etc.

WebDriver Architecture

The WebDriver Architecture includes four major components:

1. Selenium Client library
2. JSON wire protocol over HTTP
3. Browser Drivers
4. Browsers

Selenium: Web Architecture

1. Selenium Client Libraries/Language Bindings:

Selenium supports multiple libraries like Ruby, Python, Java, etc. Selenium developers have developed language bindings to provide multi-language compatibility. Thus, in its context, you can use Python Bindings if you aspire to use the 'browser-driver' in Python. From the
