

To locate a particular HTML item or a certain HTML item collection, you use a locator expression. The locator expression is essential as it contains a value pair of locator type and locator value.

The locator type and value figure out everything on the web page, such as which aspects of any HTML element get access and used for comparison to locate the HTML element.

4. Modifying HTML elements

The next step is to connect with the HTML elements. Apply an interactive method around a procedure of a WebElement interface to perform an action through the HTML elements.

Here, WebElement interface states basic methods of interaction, such as:

- The clear method, for clearing, entered text
- The sendKeys method, for entering a text
- The submit method for submitting a form.

5. Evaluating the browser response to changes

After following the above steps and clicking on the submit button, you need to wait for a few seconds. Your action takes time to reach the server and you still have to wait for a response from the server.

If you want to build this waiting period into your test, you need to follow the process. You will have to build this waiting period into the test if you are trying to find out the further response afterward.

Not following the steps would result in the failure of the elements needed to have appeared in the browser for the concluding stage. Here, the WebDriver API provides two main approaches for user response anticipations by waiting: implied waiting and explicit waiting.

Note:- Never mix the aspects of Explicit and Implicit Waits that can result in unnecessary delays.

Implicit and Explicit waits

In most instances, to perform better actions and move effectively for the next steps, automated tests seek a method to wait for some time. That is the reason Selenium WebDriver introduces Implicit and Explicit Wait.

- **Implicit Wait** - This Wait is used across projects. Through this, the system waits for an element to appear on the page until the waiting period is exhausted. However, using implicit Wait is not the best
