

practice, because the browser response time is unpredictable. Yet, it is less technically sophisticated than Explicit wait.

- **Explicit Wait** - It is utilised in cases where you have to wait until some condition occurs before moving forward. Explicit Wait, simple definition is Thread.sleep process. Other complex waits are also used along with it. They include WebDriver-Wait, E & Expected-Conditions. In these, we can categorise the time-interval in seconds. To use Explicit Wait, you are required to create a WebDriverWait class instance with maximum wait time and also invoke the until method.

6. Building a test framework to run specific tests and track results

Your primary goal is running tests and reporting test results. You need to assess the AUTO feature and output. So, without any human involvement, you run tests in an automatic test script.

In the programming language, you use test framework methods to run tests and report test results. Several test frameworks are available such as the XUnitfamily Frameworks.

However, there are some helpful and simple commands that you can follow for better interaction with the page.

Simple commands to drive the web

Selenium WebDriver offers a broad series of commands that can be used to execute better web page interaction. Such commands are extremely clear and quite simple to remember.

Some of them are:

- By – Class used with locator to find a web element
- findElement – Find the first web element of the page
- Click – Perform a click action
- sendKeys – To pass text content to an input field
- getText – Get the text content from a web element
- submit – To perform ‘submit action’ on the page
- navigate() – To navigate to a URL, forward or backward
- getAttribute – Get attribute values from the web element
- switchTo() – To Switch to window, frame or an alert
- isEnabled, isDisplayed, and isSelected – Get status of the web element
- getCurrentUrl – Get the current page URL
- get – To navigate to the web page
