

The traditional software testing methodologies are also witnessing a comeback as more companies have started to realise that relying on beta testers isn't always the best course of action for producing a quality product. Hence, QA teams are seeing a growth across the board. The ongoing pandemic might have slowed down certain industries but IT companies have been some of the few to have recovered quicker and even grown further than most other companies. Thus, the demand has already risen. Case in point, Accenture's stock dropped when the pandemic worsened in March 2020 and has now grown past their previous maximum and is now at an all-time high.

This FastTrack looks at the domain of software testing and all the tools that are commonly used by QA testers. We also look at career prospects and also several DIY sections to get an overview of how QA testers go about nitpicking at their projects. We hope that this FT piques your interest in software testing.

As always, we're listening to your requests for future FastTracks. Let us know via email on editor@digit.in. Enjoy reading.
