

Fuelling customer engagement is the trump card for growing in the app development industry. It leads to new and innovative features in applications. In the process of delivering tech-consumerism, app developers shouldn't forget about providing a bug-free app that performs to the needs of the customer.

Thus, to cater to the growing need for apps that are bug-free and error-free, you need an efficient testing process. Developers need a testing process that is not only fast but caters to the requirements of the industry. An automated testing process naturally meets these requirements.

Appium: automating app development process

Appium is an open-source automation framework. It was developed in the year 2012 by Dan Cuellar, who faced a problem with the length of the testing framework available during those times. Hence, he developed an open-source framework that caters to all sizes and languages of codes.

Appium automates all kinds of application processes that make the app testing process flexible and efficient. This framework has gained scalability in the tech-consumerism industry. It has gained much popularity in this industry in a very short period.

Many developers have ranked it among top frameworks for mobile testing. The domination of the app testing framework can be seen in the Android industry and iOS industry, where it has a market share of 35 percent and 40 percent, respectively.

Doctrines of Appium

Appium has emerged as one of the best app testing platforms for app developers because it adhered to the well-laid-out philosophies. These philosophies lay out a plan to optimise the app testing architecture to the growing reliance on mobile applications around the world.

Listed below are the doctrines to which Appiums strives by:

- No recompilation to induce the automated framework for the process of app testing.
- Developers need not stick to a particular language for writing the codes for their Apps. Appium is a flexible framework for developers to choose their language for the developmental process.
- Appiums believes that an automation
