

## How does the REST API work?

Appium rests on the abilities of the REST API. It allows ease of manoeuvrability to developers while going about the app testing process. You can easily search for the feature that you are looking for, and it represents itself in the simplest form to be used by developers. Below is a detailed list of functions performed by the REST API:

- Clients enter their requests on the API.
- The request is propagated to the centralised server.
- The centralised server listens to the demand of the clients.
- Centralised server moves to execute the command.
- The results are propagated to the client as an HTTP response.

This has been beautifully described in the image below:

Working of a REST Framework

## How can developers work on Appium?

Appium automates the process of app testing on its user interface, which makes it extremely fast and reliable. The App interacts with the clients automatically by making use of generic search tools such as buttons and labels. This feature makes the app highly suitable for developers as it provides a user-friendly atmosphere for them.

Apart from this, codes on Appium can be used for all kinds of platforms. This feature allows developers to save time. Also, Appium can be used for multiple testing sessions for testing applications on its interface. Developers can write and edit codes easily and feasibly.

## How does Appium work for Android devices?

Android has been one of the best selling Mobile OS across the world. It is backed by a great architecture that allows a friendly user-experience for
