

# Resources

A good software tester is always learning, here are a few resources

## Introduction

When the computer was first invented, people could not have imagined how it would take over the world. Almost two centuries later, the world has been split into two- a real and a virtual one, thanks to the computer, and of course, the Internet.

There are plenty of things driving a computer that make it what it is. However, there is one that is the most important of them all – software. Software is a program that collects instructions from a user and has a computer execute them. Everything in the virtual world has been made using software. Companies around the world that rely heavily on computers and the Internet, need a large number of software to tailor their procedures. Of course, each software is created for a specific purpose. For example, there could be software to help with the clients and another to keep track of employees.
