Django is renowned for its flexibility and how it helps developers get more significant payouts. According to Indeed.com, a Python Django developer can get as much as \$119,096 per year on average. To compare this with other web frameworks like Laravel, a PHP framework, one would get about \$85,590 per year. Django seems to be a clear winner.

The latest Django 3.1.2 comes with a solution for the regressions in `QuerySet.ordered` attributes which used to return incorrect with earlier versions. The latest update also improves `FileField` instances. The journey from Django 2.2 to the latest stable version 3.1 has been remarkable. So, let's get to know more about the Django, a web framework from Python.

What is Django?

Django is an open-source web framework from Python. It is one of the most pragmatic frameworks that offer rapid web development through a clean and maintainable code. Django is also used for developing web apps and comes with a dedicated web app toolkit that has all the essential components for development.

Django web framework allows developers to redirect their efforts to new components rather than the ones they have already developed. Most of the enterprise-grade web apps deal with data-driven features. Here, Django acas other web frameworks in the market. It also helps handle multiple data sources and the dynamic elements of your enterprise web apps.

Factors that make Django popular as a Python framework

MVT Architecture

Django explores MVT(Model-View-Template) architecture instead of the conventional MVC (Model-View-Controller) architecture. The model part of the architecture handles the database access layer, consisting mostly of attributes and properties of data manipulations.
