

- ```
def __str__(self): # __unicode__ on Python 2
```
- ```
return self.content_title
```

Version Support

Django was launched way back in 2005 with a BSD license, which is also known as an open-source license. Since then, there have been many changes and versions of the web framework from Python. The best thing about Django is its backward compatibility. It supports all the versions since its inception.

DevOps Compatibility

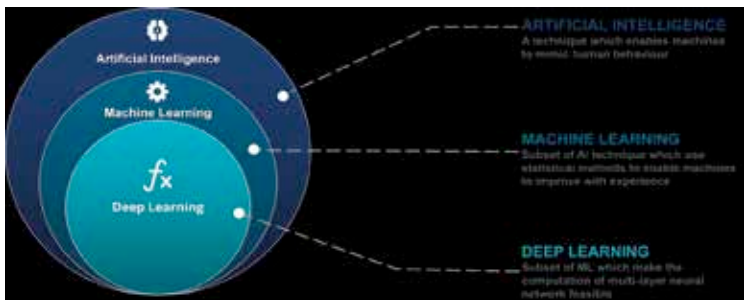

DevOps combines many different best practices to maximise development tools and achieve rapid development. Django is compatible with DevOps practices as it enhances web development and is faster than other frameworks.

Code Optimisations

Django helps with simple and short codes. Minimal codes can help to keep the web app light and fast. It will also help reduce the memory footprint and improve loading speed. Django is also known for its capabilities to reduce repetition in coding. It helps with reusable codes to make duplication of coding redundant.

Best of REST

If you are a developer or a programming student, you might have heard of REST APIs. If not, APIs are a set of protocols that help authenticate, validate and exchange the data between heterogeneous systems. While the REST or Representational State Transfer is a type of framework that helps
