

So there is no doubt that Python has much more in store. But, recently, the web framework has seen some popularity as a backend tool when it comes to Django. As the framework with an inheritance from a data-intensive language like Python is evolving, developers use it with other front-end tools.

For example, if you are thinking of starting a career in web development, Django should be your first choice. Because if you know REST APIs, you can use Django for backend and frameworks such as React.Js for the user interface.

In conclusion, from the MVT architecture to model inheritance feature, and even the asynchronous view support, Django has evolved. It has become the beacon of hope for new and upcoming developers due to its popularity in the market. As we discussed, it is one of the highest paying frameworks to learn. Django offers a better prospect for developers compared to other technologies.
