

Requests and responses

For proper communication, one needs to master the art of handling requests and responses

A request object is developed with default parameters that are applicable for a number of URL requests, but their class defines a rich set of methods that can be utilised to customise user requests for a particular objective. This request is registered in the application library by simply issuing a URL operation. Most often, the request objects are created in the spiders or passed across the node until they reach a user. The users can further execute the “request” and return “response” objects with it, which travels
