

request does not highlight a callback, then the spider method can be used, i.e., `parse()`. If the exceptions are raised while processing the `errback`, it is known as `instead`.

- **Method**- The HTTP method of the object request defaults to “GET”.
- **Meta**- It is the initial value of the attribute `Request.meta`.
- **Body**- It is the request body where if the Unicode is passed, then it gets encoded with the help of “encoding” parameters. If the body is not given properly, then any empty string gets stored.
- **Headers**- The dict. value can either be lists or strings, which is also the header of the object request.

HTTP Requests

Start Line

HTTP requests are the message indications sent by the client for initiating any action on the server. The start line of the HTTP request is inclusive of three basic elements, which are as follows:

- An HTTP method for describing the action that has to be performed on the server. For example, the “GET” method indicates a resource that has to be fetched, and the “Post” method pushes the data to the server. In other words, it means developing or modifying the resource and generating any temporary document out of it to send back.
- The request-target is usually an absolute medium of the protocol and domain or URL used for characterising the request context. The format of this type of request targets the variations between different HTTP methods. This can be-
 - An absolute path which is followed by a query string and “?”. It is framed as a common format and is used along with methods like GET, HEAD, OPTIONS, and POST.
 - An entire URL which is known as absolute form. It is mostly used along with a method like the ‘GET’ method to connect to the proxy.
 - The authority component of any URL which consists of the optional quote and domain name is known as the ‘authority form’. It is used with the ‘COMMAND’ method for setting off an HTTP tunnel.
 - An asterisk form has a simple asterisk and can be used along with the “OPTIONS” method in order to represent the server mediums as a whole.
- An HTTP version that elaborates the structure of the rest of the mes-
