

- It can create a database schema for the app, for instance, 'CREATE TABLE' statements.
- It can develop a Python-based API to access the database promptly. This API is created to access Questions and Choices directly from the database itself.

We also need to tell our 'Project' that we have successfully included the 'Poll App'.

As we know, Django is a scalable platform; therefore, all their apps are pluggable. That means different projects can use this one app to perform certain tasks. They don't need to write code again for the same tasks. We have the feature of redistribution of Django App. This is possible because the Django app is not tied to any specific Django installations.

Now, the next step is to include this app in the main project. For attaining this, simply add a reference to the project configuration class which you can find in 'INSTALLED_APPS' settings. Now, follow this step by step.

1. Find the 'PollsConfig class' in 'polls/apps.py file'.
2. You will have a dotted path that is - 'polls.apps.PollsConfig'.
3. Now, edit the 'mysite/settings.py' file.
4. In the 'INSTALLED_APPS' setting, add the above-dotted path in it.
5. You will get the following as displayed below in the image.

```
mysite/settings.py

INSTALLED_APPS = [
    'polls.apps.PollsConfig',
    'django.contrib.admin',
    'django.contrib.auth',
    'django.contrib.contenttypes',
    'django.contrib.sessions',
    'django.contrib.messages',
    'django.contrib.staticfiles',
]
```

With this, our Django now knows that finally the 'Poll App' has been included successfully. In the image below is another command that we need to run after this (run as per your operating system).
