

This includes the collection of several settings for Django instances. This will include a database configuration, specified options for Django and application-based settings.

Through the command line, perform the CD into the directory wherever you are likely to put your code. Now run the following command as displayed in the image (run as per your operating system).

```
$ django-admin startproject mysite
```

```
...> django-admin startproject mysite
```

‘mysite directory’ will generate in the current directory.

3. Run Development Server for Verification

Also, you have to verify that your Django project is working on your development server. So, in order to verify our Django project we need to do some changes in the external “mysite” directory. After then need to run the following commands as shown in the images (run as per your operating system):

```
...> py manage.py runserver
```

```
$ python manage.py runserver
```

Here is the command line output:

```
Performing system checks...
```

```
System check identified no issues (0 silenced).
```

```
You have unapplied migrations; your app may not work properly  
until they are applied.
```

```
Run 'python manage.py migrate' to apply them.
```

```
September 23, 2020 - 15:50:53
```

```
Django version 3.1, using settings 'mysite.settings'
```

```
Starting development server at http://127.0.0.1:8000/
```

```
Quit the server with CONTROL-C.
```
