

4. Creating the Poll App

Now we have completed all the basics functions. It's time to develop our Poll App.

Every application that we write in Django contains Python packages. It follows some specific conventions. Django is developed with a utility module that can generate a basic directory for app structure automatically. Hence, we can focus more on code-writing instead of common directory creation tasks.

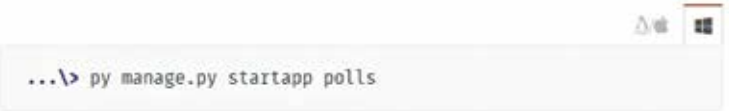

Python path is the place where all our Python apps live. Now, here we can create the poll app in this directory which is the same – 'manage.py file'. Why? Because then it can easily import similar top-level modules, instead of importing the submodule of 'mysite'.

So, to create this app, You have to make sure that you are present in the same directory, i.e., manage.py/. You need to type this command (run as per your operating system).

A terminal window with a light gray background and a dark gray title bar. The title bar contains three icons: a red close button, a yellow maximize button, and a green window button. The terminal text is as follows:

```
$ python manage.py startapp polls
```

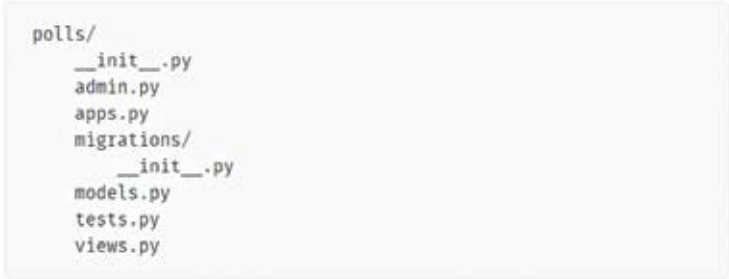

The prompt is a dollar sign followed by a space. The command is `python manage.py startapp polls`.

A terminal window with a light gray background and a dark gray title bar. The title bar contains three icons: a red close button, a yellow maximize button, and a green window button. The terminal text is as follows:

```
...> py manage.py startapp polls
```

The prompt is three dots followed by a greater-than sign and a space. The command is `py manage.py startapp polls`.

It will create a Poll directory and will be displayed like in the image shown below.

A code editor window with a light gray background and a dark gray title bar. The title bar contains three icons: a red close button, a yellow maximize button, and a green window button. The code editor shows the following file structure:

```
polls/  
  __init__.py  
  admin.py  
  apps.py  
  migrations/  
    __init__.py  
  models.py  
  tests.py  
  views.py
```

The root directory is `polls/`. It contains `__init__.py`, `admin.py`, `apps.py`, `migrations/`, `models.py`, `tests.py`, and `views.py`. The `migrations/` directory contains its own `__init__.py` file.
