

This is the directory structure of the poll application which holds it.

5. Writing view

Now, the next step is to write the view. For which you need to open this file 'polls/views.py' and then place the below shown Python code in this file.

```
polls/views.py

from django.http import HttpResponse

def index(request):
    return HttpResponse("Hello, world. You're at the
polls index.")
```

This is the simplest possible view in Django. To call this view, we will simply map it to the URL with the help of 'URLconf'.

To create the URLconf in 'Polls directory', you need to create a file known as 'urls.py'. After doing this, now your application directory will look similar to the following image:

```
polls/
  __init__.py
  admin.py
  apps.py
  migrations/
    __init__.py
  models.py
  tests.py
  urls.py
  views.py
```

Include the below-shown code in the 'polls/urls.py file' –

```
polls/urls.py

from django.urls import path

from . import views

urlpatterns = [
    path('', views.index, name='index'),
]
```
