

operations (Create/ Update/Delete/Add) is a boring, tedious and time-consuming task. Django solves your problem as it can entirely automate the creation of all the admin interfaces for each model.

Django solves problems specific to the creation of a single unified interface. It is helpful for site administrators as they can easily do these administrative tasks.

1. Create an admin user

Here, using this command, we will create a user who can log in into the site (run as per your operating system).

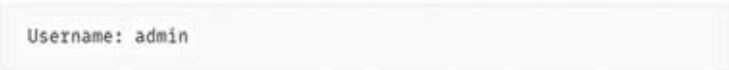

```
...\.> py manage.py createsuperuser
```

```
$ python manage.py createsuperuser
```

Enter the desired username and then press Enter.

```
Username: admin
```

You will be asked for the desired email-id address:

```
Email address: admin@example.com
```

Now, finally, enter your password.

```
Password: *****  
Password (again): *****  
Superuser created successfully.
```

2. Start the development server

The Django admin site is by default activated. Now we can start our development server and explore all the options. In case, for any reason
