

Making Our Poll App Modifiable From The admin

So, if you do not see the Poll App on the admin index page, do not worry as there is one last thing to do here.

You have to tell the admin that the 'Question objects' contains an 'admin interface'. To perform this, you need to open 'polls/admin.py file' and from there modify to the code mentioned below in the image:

```
polls/admin.py

from django.contrib import admin

from .models import Question

admin.site.register(Question)
```

5. Explore the free admin functionality

All the registered Questions will be displayed on the admin index page.

Site administration

The screenshot shows the Django Admin interface. On the left, under 'AUTHENTICATION AND AUTHORIZATION', there are links for 'Groups' and 'Users', each with '+ Add' and 'Change' options. Below that, under 'POLLS', there is a link for 'Questions' with '+ Add' and 'Change' options. On the right, the 'Recent Actions' section shows 'My Actions' and 'None available'.

Now as shown in the image below, you have options to click on the "Questions". Now from here, you are moved to the 'change list' web page for the questions. Now, this page will display all questions from the database and you got an option to change anyone as per your needs. Here's a 'What's up?' question that we have created in earlier steps:

The screenshot shows the 'Change list' page for Questions in the Django Admin. The breadcrumb trail is 'Home > Polls > Questions'. There is a search bar labeled 'Select question to change' and a 'NEW QUESTION +' button. Below the search bar, there is a table with one row for a question titled 'What's up?'. The table has columns for 'Action', 'Question', and 'Poll'. The 'Question' column shows 'What's up?' and the 'Poll' column shows '1 question'.
