

- i. It goes through higher complexity when developing applications using this pattern.
- ii. It is not suitable for small applications and adversely affects the application's performance and design.
- iii. The Servlet and JSP often contain the business logic and presentation tier.
- iv. The isolated development process may delay the development of the respective module by UI, business logic, and controller authors.

MVT or MTV Architecture

MVT or MTV is a software design pattern consisting of the model, the view, and the template, and here too the model signifies the data to be handled, the view acts as a link between the data and template and the template's functionality is the same as view in MVC architecture.

The following is a detailed description of each part of the MVT model:

1) Model

The model in MVT is the same as that of MVC. Its main role is to provide the interface for the data stored in the database, file, or object of an application.

2) Template

The functionality of the template in MVT is just like a view in MVC. A template is responsible for the entire User Interface. It handles the static parts of a webpage along with HTML, which the users can see.
