Understanding Templates

Templates are an intrinsic part of Django's MVT architecture. The visual template uses HTML, CSS, and Javascript. The Django framework handles and dynamically generates HTML web pages visible to the end-user. Django functions with the backend to provide a frontend and a layout to a website or an application.

Django's template system makes it possible to display an HTML page. This system follows a method to create and deliver template files and a language used for building the template.

Elements of a Template

Here are some sections that are associated with Django templates:

Template Tags

Django has some built-in template tags that are used to display the data inside a template. It is not possible to write Python code in HTML as the browser will not understand it. HTML is static, while Python is more of a dynamic language.
