

```
head _css _page %}
•     {% endblock head _css %}
•     </head>
```

Here is how the lines of code will be executed:

**Line 1:** Django template comments are created, which are non-executable.

**Line 6:** The [% block %] tag represents the blocks that are the key part of the template language. With blocks, you can specify parts of the base.html file, which can be changed by pages extending it. Line 8 in the code specifies the HTML title element. It provides a default value. Any page extending the base.html can easily change the title by writing {% block title %}

**Line 9:** Variables are displayed using the {{ STATIC\_URL }} syntax. Here, the STATIC\_URL variable comes from the settings.py file and provides the correct path to static files. The values can be passed from views to templates and displayed using the {{ variable }} syntax.

## Adding the Page Body

The base.html body has three main parts: the navigation elements, the main content area and the footer. This code is written in the base.html file immediately after the above code.

```
• <body>
•     {# Navigation Menu #}
•     <header>
•     <div class="navbar navbar-default navbar-static-top"
•         {% block nav-style %}{% endblock %}">
•         <div class="container p-none">
•         <div class="navbar-header">
•             <button type="button" class="navbar-
toggle"
•                 data-toggle="collapse"
•                 data-target=".navbar-col-
lapse">
•             <span class="icon-bar"></span>
•             <span class="icon-bar"></span>
•             <span class="icon-bar"></span>
•             </button>
•             <a class="navbar-brand" href="/">CRM
Easy</a>
```
