

In the `base.html` template, the `'if'` statement is used to detect if the user is authenticated or not. It then changes the menu options as per the inputs.

Adding JavaScript Blocks

JavaScript (JS) is an important part of modern web applications. The JS blocks in the `base.html` file can override the values set by the main `base.html` file.

```

• {# Blocks used to display JavaScript files #}
•     {% block footer_javascript %}
•     {% block footer_javascript_site %}
•         <script src="{{ STATIC_URL }}js/jquery.min.
js"></script>
•         <script src="{{ STATIC_URL }}js/bootstrap.
min.js"></script>
•         <script src="{{ STATIC_URL }}js/app.js"></
script>
•     {% endblock footer_javascript_site %}
•     {% block footer_javascript_section %}{% endblock
footer_javascript_section %}
•     {% block footer_javascript_page %}{% endblock
footer_javascript_page %}
•     {% endblock footer_javascript %}
• </html>

```

Step 3: Commit changes

In this ultimate step, the commands are executed and changes are committed in Git with the following code:

```

• # add files
• (venv)$ git add.
•
• # commit files
• (venv)$ git commit -m " the base template is created"

```

Creation of a Template File

This is a brief explanation of all the aspects that come in when creating a template file.

Every template has its file. For instance, the home page template can be named `home.html`.

Each page in the CRM easy application has at least one template file.
