

```

•         {# Second Signup Link #}
•         <a href="" class=" sgn-btm ">SIGN UP FOR ONLY $15/
MONTH</a>
• </div>

```

Step 4: Commit changes

This is the final step for executing the commands and committing the changes in Git.

```

• # add files
• (venv)$ git add.
•
• # commit files
• (venv)$ git commit -m "the home page template created"

```

Composing a Template File

Templates are made with a special template language that is quite powerful. It defines the user-facing layer of an application, promotes the application division and presentation logic. Django's response cycle responds to the requests with a template file. The developer will create the template files, which are written in Django's template language. It is a combination of HTML and simple programming logic.

Configuring Template Settings

We need to configure a few things for serving templates. First, create a folder where template files are saved. This folder is created in the directory. After this, the settings.py file is updated. Django will render template files after enabling an additional context processor.

Step 1: Create the Templates Folder

This is the first step where the templates directory is created.

- In the `/.../crmeasy/crmapp` folder, create a `templates/` folder and it's done.

Step 2: Locate the Templates Folder

Update the settings.py file with the following steps:

1. Open the `/.../crmeasy/crmapp/settings.py` file
2. Add this code at the end

```

• # Template directory setting
• TEMPLATE_DIRS = (

```
