Creating a Model Form

Let us try and recreate the above form with the help of Model Form in Django.

First, we need to create a model with the desired field names. We also have to specify the data type of the expected input.

```
• from __future__ import unicode_literals
• from django.db import models
•
• class Student(models.Model):
•     first_name = models.CharField(max_length=20)
•     last_name = models.CharField(max_length=30)
•     class Meta:
•         db_table = "student"
```

Then, we can create a form that inherits the above model to get the fields.

```
• from django import forms
• from myapp.models import Student
•
• class EmpForm(forms.ModelForm):
•     class Meta:
•         model = Student
•         fields = "__all__"
```

The next step would be to define a function that loads the Model Form.

```
• from django.shortcuts import render
• from myapp.form import StuForm
•
• def index(request):
```
