

```

•     stu = StuForm()
•     return render(request,"index.html",{ 'form':stu})

```

Now, we have to specify the path for the user input to be stored.

```

• from django.contrib import admin
• from django.urls import path
• from myapp import views
• urlpatterns = [
•     path('admin/', admin.site.urls),
•     path('index/', views.index),
• ]

```

Finally, we have to add the index code, then we can see the form is ready.

```

• <!DOCTYPE html>
• <html lang="en">
• <head>
•     <meta charset="UTF-8">
•     <title>Index</title>
• </head>
• <body>
•     <form method="POST" class="post-form">
•         {% csrf_token %}
•         {{ form.as_p }}
•         <button type="submit" class="save btn btn-
default">Save</button>
•     </form>
• </body>
• </html>

```

Views in Django

Views are a part of the Model, View, Template (MVT) structure. MVT can be understood as the pattern of a software design that is used in Web Application development.

The view is basically the User Interface that gets loaded when you render a website. It is represented by the HTML, CSS, JavaScript, or Jinja files.

The Django documentation defines the view as a Python function that can take a web request and return a web result on the screen. The views are basically of two types:

1. Function-Based Views
2. Class-Based Views
