

Python is a popular framework among developers and programmers around the world. It is used not just for advanced technologies such as artificial intelligence and machine learning but also for web development. Django is a web framework for Python that has been around for more than 15 years now.

Django has been regarded an efficient web framework over the years due to its capabilities of handling data-driven website development. Any web framework is a code repository that can help developers build different types of web services. You can develop web apps and dynamic websites that are flexible, scalable, and maintainable.

The web framework from Python has powered more than 78,958 websites over the years. Many organisations and businesses have put their faith in Django:

- Pinterest Engineering
- Dropbox
- IBM
- Google
- Reddit
- Bitly
- Quora
- Youtube
- Udemy
- The Onion
- Disqus
- Washington Post
