

```

• def test_object_name_is_last_name_comma_first_name(self):
•     author = Author.objects.get(id=1)
•     expected_object_name = f'{author.last_name}, {author.first_name}'
•     self.assertEqual(expected_object_name, str(author))
•
• def test_get_absolute_url(self):
•     author = Author.objects.get(id=1)
•     # This will also fail if the urlconf is not defined.
•     self.assertEqual(author.get_absolute_url(), '/catalog/author/1')

```

Forms

We can test all the form fields for their labels and text representations. Django can help automate the test; however, custom tests can help you identify the errors.

```

• class RenewBookForm(forms.Form):
•     """Form for a librarian to renew books."""
•     renewal_date = forms.DateField(help_text="Enter a date between now and 4 weeks (default 3).")
•
•     def clean_renewal_date(self):
•         data = self.cleaned_data['renewal_date']
•
•         # Check if a date is not in the past.
•         if data < datetime.date.today():
•             raise ValidationError(_('Invalid date - renewal in past'))
•
•         # Check if date is in the allowed range (+4 weeks from today).
•         if data > datetime.date.today() + datetime.timedelta(weeks=4):
•             raise ValidationError(_('Invalid date - renewal more than 4 weeks ahead'))
•
•         # Remember always to return the cleaned data.
•         return data

```
