

Alongside the Windows and Mac versions of Office, the mobile versions have also been catching up swiftly. Most Microsoft Office software are available in the form of apps in major mobile operating systems. Microsoft has also introduced many mobile-only apps as a part of its Office suite on mobile. The Microsoft Office app includes Word, Excel and PowerPoint in a single interface and allows users to scan QR codes, sign PDFs and even take notes. The Office Lens app is an image and document scanning app for mobile devices, on the lines of other previous apps such as CamScanner and Adobe Scan. The Office Remote app is primarily used as a remote control for presentations, but can also be used for Excel and PowerPoint.

Microsoft Office 2019 was released in late 2018 and brings a lot of updates in each software of the suite. The following list will feature only the updates that are common to most apps included in Microsoft Office.

1. Microsoft Translate in Office:

As the world has been getting more globalised, exchange of data and information among cultures has been increasing by leaps and bounds. A number of countries in the world do not use English. They prefer to not just speak, but also conduct documentary exchange in their languages. Hence, most of their documents will naturally be written in their native language, be it French, German, Japanese or Mandarin. Similarly, if you are a citizen of one of these countries, English might not be your first or even second language, and might not come as naturally to you as to citizens of some other countries.

If you come across a document from a client that is not in a language you know, you would traditionally go to an online word translator portal. The most prevalent among these is Google Translator, followed by the Microsoft Translator hosted on Bing. Using one of these would generally entail having to copy the text to be translated and paste it on the translator portal, hoping the language would be available in the translator.

However, over the past few years, the translation capabilities of these translators have improved significantly, through incremental changes almost every week. This caused Microsoft to introduce a Translate option in Word, Excel and PowerPoint. You can now choose to translate either the whole document or a section of the document into or from any language that is compatible with Microsoft Translator. In previous iterations of Microsoft Office, you could only set a document language, but would still have to type in that language yourself. Now, you can potentially type the whole document in English and then translate it to Japanese for your interlocutor.
