

More than three and a half decades later, Word continues to grow through its many updates. Developers spend months to come up with bug fixes and to introduce newer, better options that coincide with the interests of their customers. The company ensures they are on par with their toughest competitors like Google, which, too, introduced a rather useful package containing the popular 'Google Docs'.

Amidst all the updates that Word has been given over the years, a few stand out. Before 2018, Word was still quite in its preliminary zone with no revolutionary changes as such. However, the 2019 update changed the way people looked at the software, completely! We will discuss Word's leap from a regular text editor to one of the most powerful text editors in the world, in this article.

What's new

After the 2019 update, Word changed completely. In fact, that update laid the cornerstone for how the application is perceived today by its users. Microsoft introduced some long-awaited options that changed the terrain of this text editor. This only consolidated its place among the loyal users all the more; proving more so that it was hard to replace such an application, if not impossible.

The entire update, at least the parts with maximum significance, happened over three main categories: general changes to the application, changes to the visual interface, and changes in accessibility. All the three are broken down into detailed summaries below.

Microsoft 2019 update

General changes

The general changes of Microsoft Word encompass the introduction of a few options that were long overdue. These have been the most impactful in
