was not supported in Word. But now, with the new update in place, you can use a digital pen to draw or write directly on Word. All you need is a touch device. Given how the previous years saw a boost in sales of smartphones and other touch screen devices, this was a great move from Microsoft to make the application more inclusive. Moreover, this update also made it a lot cooler for tech geeks who could now have the freedom to scribble all over blank documents.

• LaTeX syntax if you are a math geek:

With all the previous points discussed and dissected, it is time to acknowledge the dream of math geeks- LaTeX. Word incorporated the LaTeX format into their interface in 2018. With LaTeX, you can write and edit mathematical equations. While it was almost impossible to type in those critical, complex equations into a document, Microsoft made it easier by adding LaTeX. Definitely a good news for all mathematicians with tons of research papers coming up!

Mathematical equation using LaTeX

Visual changes

Like the general changes, the visual changes created a lot of impact too. These options were incorporated mostly for the designers who preferred using Adobe over Office for all designing purposes. Although Adobe is still the first choice of many top tier designers out there, Word became a great place to start, and to experiment. With the addition of their new icons and graphics, things became easier for all kinds of writers and researchers who looked up to Word all along.

• Add more scalable icons with vector graphics:

Word introduced new kinds of icons in the 2019 update. These icons
