

SWITCH

The SWITCH function in Excel 2019 exists to evaluate a particular statement against the backdrop of a preexisting roll of values that have been arranged in a specific order. Post evaluation, the function displays the result which is the first match. In the event that no results happen to match, the else statement is returned which, in most cases, is an optional default value.

TEXTJOIN

The purpose of the newly introduced TEXTJOIN function is to combine text from different ranges. Each item in the function is split up by a delimiter that the user specifies. While invoking the TEXTJOIN function users need to remember that if the resulting string exceeds the stipulated cell limit of 32767 characters, then the function will return the #VALUE! error.

New charts

Along with introducing a host of new functions, Excel 2019 also has a few new charts for its users. The new charts are the following:

Map charts

This newly introduced feature allows the user to create a map in order to facilitate the comparison of values and the showcasing of categories across various geographical regions. One can make use of the map charts feature when their data consists of geographical regions, such as countries, regions, counties, and postal codes.

Funnel charts

The purpose of funnel charts is to show all those values that exist across various stages present in a pipeline. Let us consider the example of a conventional sales pipeline. By making use of the funnel charts feature, the user can conveniently showcase and highlight the specific figure of sales probabilities at each and every stage of that particular pipeline. In a typical funnel charts, the values tend to undergo a gradual decrease, thus giving the resultant assemblage of bars a resemblance of a funnel.

Improved visuals

Apart from being a tool of data management and manipulation, Excel is an excellent tool of data visualisation and representation as well. Often when dealing with large databases, an user requires to visualise small portions
