

General improvements

There are always a host of customary improvements that Microsoft introduces to its audiences with every new Office suite release. Here is a list of all the general improvements in the new Office 2019 suite

Precision selecting

At some point or the other, while using spreadsheets, all of us have fallen prey to selecting excessive cells at once or selecting the unnecessary or wrong cells altogether. Often this action leads to inconveniences to the end user. With the new Excel 2019, one can deselect irrelevant cells without resorting to starting all over. This feature works well towards enhancing the time management and the overall productivity.

Superscript and subscript

While working on mathematical and scientific documents, an user often finds themselves having a persistent need for the superscript and subscript commands. Excel 2019 now presents one with a hassle free solution to this feature by allowing them to keep at their fingertips all the relevant commands extending to subscript and superscript. You can achieve this by adding these commands to the Quick Access Toolbar.

New autocomplete

The updates and upgrades that are part of the Office 2019 suite have effectively ensured that the autocomplete feature in Excel 2019 is not as choosy as it used to be in the previous editions. Earlier an user required to spell the function name without any error whatsoever, to avail the services of the autocomplete feature. Now, only a mention of the keyword prompts the autocomplete dialogue box to bring back the functions that include the said keyword, thus making matters significantly convenient for the user.

New themes

In order to enhance user experience, Microsoft has now introduced three new themes in Office that a user can avail. According to their whim and mood, an user can use any of the Colorful, White, and Dark Gray themes to change the appearance of their interface.

Black theme

Keeping in tune with recent trends and tastes, Microsoft has also rolled out
