

Faster OLAP PivotTables

Excel 2019 has brought with itself a host of improvements that reflect primarily in three significant areas while querying OLAP servers. An enhanced query efficiency now lets Excel query for Grand Totals and Subtotals only if they are necessary to yield the requisite results. This means that now the user has to wait less for both processing their query as well as for results to traverse over their network connection. Introducing smarter caches and a reduced amount of queries further presents novel avenues for enhanced functionalities.

Power Pivot Relevant Updates

Relationship diagram

Saving the data model diagram view as a high resolution image file enables the user to use the resultant file for sharing and printing purposes as well as analysing the data model.

Edit Relationship

By allowing its users to manually add and customise a table relationship while simultaneously facilitating the exploration of a data sample, Power Pivot has paved the path for creating faster and more precise relationships without needing to go back and forth to the data view for every time that you wish to create, or edit a table relationship.

Table selection

With the help of the Edit Relationship dialogue, users can type the first letter of a table name to move the first column name starting with the selected letter.

Column selection

Similar to table selection, a user has to type the first letter of a column name to move the first column name starting with the selected letter.

Column suggestion

Courtesy this feature, should a column name with the same name happen to exist in two tables, it will get auto-selected.

User experience

Following the new upgrades, users have to no longer worry about losing their Power Pivot data models while working with hidden workbooks. Additionally, along with upgrading an earlier workbook with a data model
