

in your slides. Morph transition can be used to create the appearance of movement among slides in shapes, pictures, WordArt, graphics and even text. The only caveat in using Morph transition is that the two slides that you apply them between should have at least one object in common among them. The easiest way to ensure this is to take an object from the first slide and simply paste it on the second slide. Now, go to the second slide. Click on the Transitions tab. In the list of transitions, click Morph. Your Morph transition will be ready.

2. Zoom:

Zoom is a new functionality in PowerPoint that is essentially like an index page for your presentation. This does resolve a years-old problem for users who like to go back to an index page before moving on to the next topic. Before Zoom came around, users would have to build an index page with pictures, shapes or text connected to particular slides via a hyperlink. This was certainly a tedious process, and an accidental click here or there could upend the whole presentation. With Zoom, PowerPoint builds automatic hyperlinks to the slides or sections that you want to connect to and allows you to come back to the landing page once you are done with explaining them. There are three types of Zooms that have been introduced in PowerPoint 2019 - Summary Zoom, Section Zoom and Slide Zoom.

The Summary Zoom is like a landing page or a conventional index page for your presentation; this comes as something of a boon especially for lengthy presentations. Once you are done explaining a slide or group of
