

be treated as any other shape in PowerPoint and edited nearly as much as any other object created inside PowerPoint.

5. Editing SVG graphics:

Another great advantage of using vector images in Microsoft PowerPoint is the fact that they can be edited beyond an extent to which any other kind of images can. The colour of SVG images can be changed through the Graphic Format tab, which appears when you click on the image. Not only can you opt for the default colours of PowerPoint, but choose custom colours for different parts of the image. You can change the fill, effects and outline of the graphic without impacting its quality. If the image has a complex structure, such as in an infographic or a flowchart, each element of the image can be edited separately without impacting the rest of the image. The effects available for SVG files on PowerPoint are the same as those available for all other objects made via the Insert tab on PowerPoint. You can also cause text to wrap around the SVG image, and position the image as required on the slide.

6. 3D models:

This update can only be described as yet another step into the future of presentations. While 3D models are still a few years from becoming a regular part of a presentation, the capability to add them to PowerPoint presentations when they eventually do has been included in the 2019 update. 3D models can be used in presentations for a variety of purposes. The most obvious among them is for product design firms, who now do not have to open a separate
