

that its users bring up. One of these issues had to do with the eraser. Earlier versions of the eraser in the Draw Tab would erase as much as the user required, but did not show any content awareness. This would often cause excess regions to either be erased or remain unerased, and perfection was often hard to achieve in a number of drawings. The latest version of the eraser includes a segment eraser. This is a content-aware eraser, that deletes a segment up to a point till which it meets another segment. This is much akin to the Trim tool found in a number of image editing software, in which individual line segments can be deleted.

13. Straightedge drawing:

This is yet another example of Microsoft heeding to its customers' recommendation while bringing updates to its software. A major issue faced in PowerPoint while drawing was the fact that it was very difficult to draw straight lines. A user drawing by hand, using a mouse or even using a digital pen did not have a ruler at hand if a straight line at any angle needed to be drawn. This difficulty has been addressed appropriately in PowerPoint 2019 by including the Ruler option in the Draw tab. Users can now use the ruler at any angle on the screen if they wish to draw straight lines.

14. Funnel and 2D map charts:

In line with most major data analysis software in the market, PowerPoint has also been adding new data representation methods to its options. The latest additions to these are the Funnel chart and the 2D Map chart. These charts can be used to represent cumulative data and high-level demographic data, respectively.
