

with current formats and legacy formats. MS Access saves data using its own format via the Jet Database Engine with the additional option to link or import data from third party databases and applications.

MS Access is built on Visual Basic for Applications (VBA) that supports and includes various objects such as ActiveX data objects, legacy DAO (Data Access Objects), and similar ActiveX components.

Here is a list that describes the new and improved MS Access 2019. We will study each of these points in detail:

- Introduction to new and improved modern charts
- Bigint (large number) support
- Connecting to third party support
- dBASE support returns
- Property sheet sorting
- Label names property for controls
- Introduction for the logic of ODBC connection retry
- Accessibility improvements
- Easier editing for new value list items
- Tell Me box enhancements
- Easier resizing windows
- Navigation pane scrolling improvements

Introduction to new and improved modern charts

Building charts is easier and better for visualizing. There are 11 new chart options of which users can fill the data and fields from their reports to see the presentation parallelly. You can create charts with multiple options and define custom parameters.

Undoubtedly, chart improvements are one of the major changes in Access 2019 that overtake the old style charts. Multiple options are now available with Clustered, Stacked, and 100% Stacked to offer a more enjoyable view to the users. Modification is also quite easy and done through the Access Property Sheets and Chart Settings panel.

Column charts

Column charts offer users an incredible view of the data in the vertical and horizontal axis. Users can add category displays on the x-axis as property and their corresponding values on the y-axis, respectively, to bring forth a graphic view of the data through these charts. Here is a quick representation of the column charts in Access 2019.
