

Productivity level - OVER 9000!

The single most common skill that you'll find on resumes of fresh graduates will be proficiency with a productivity suite. This includes a word processor, spreadsheets application and presentation application. Since Microsoft happens to own the largest market share, it's number one, followed by its subscription based offering, Office 365. Then comes Google's G Suite and Google Docs. All the open source software such as Apache Office and LibreOffice fall in line right after and then you have Apple's iWork suite. However, a vast majority of the folks who put these software down as skills on their resume can barely utilise some of the most powerful features that these software have. One example would be Excel's Pivot Table feature. Fun trivia - Microsoft no longer owns the trademark for PivotTable as of 2020.

Being proficient with these productivity tools means that you can properly communicate with your colleagues at work. Less time can be spent on bridging communication gaps and everyone's energies can be focused on getting actual work done. You don't want to be the one person in the room who can't put together a simple presentation or troubleshoot a formula within an Excel sheet. These skills will never be taught in workplaces as it's expected that you will be proficient with them before you begin your first job. And one of the important aspects of being skilled with a tool is to keep yourself updated with all the changes and improvements that are made to the software.

Which is why we are not focused on helping you learn Microsoft Office in this FastTrack. Each of the software present in Microsoft Office
