

Combo charts

Combo charts empower users to add or combine two or multiple chart types, for instance, a line chart and clustered chart, to get an optimised view of the data with different observation points.

BigInt (large number) support

In MS Access 2019, users have extra support for a large number of data types. Users can choose to add large numbers as a field in the MS Access table; in case you want to connect or import this field to any database to work with any specific data type. Though for using external sources, you need to enable options from the Access dialog box.

You need to go to File > Options > Current Database. Then from the options, you can check the Data Type options feature. Now, you need to select the BigInt Data type for a specific field and table to start running large numbers in your MS Access file, respectively.

Large numbers in Access have support available from -263 to +263, which is up from the prior -231 to +231.

This empowers users to add very large numbers effectively in
