

their ODBC to the limit of 263 to end at around 9,223,372,036,854,775,807, respectively. Using this data type in the database makes it incompatible with the older version of MS Access, and they are effectively non-reversible.

Enabling a large number of data type support also adds parallel support for importing or linking from all SQL server databases using the BigInt data type.

Connecting to third party support

With organizations leveraging third party support to ease their workload, MS Access has added new and improved features in the External Data tab via the From Online Services. Here, users have options for third party Data Services, Salesforce, and Microsoft Dynamics 365 for seamless connectivity.

dBASE support returns

Another Access feature that makes a comeback is the dBASE file support (with the extension .dbf). Users now have the option to import or link any data that is present in the dBASE file via Access or export data from the Access file to the corresponding dBASE file.

Importing data from dBASE files

MS Access fully supports the import process for fetching data from dBASE, which was the original management system in multiple file formats of dBASE III, dBASE IV, dBASE 5, and dBASE 7, respectively. Users have the choice for either importing or linking data to a particular dBASE file for all the latest and old updates of MS Access.

Exporting data to dBASE files

MS Access from all the versions and subscription now has support for
