

In the earlier version, this association was tricky for users who had to cut a specific label control and paste it on the required control to start an association. Users with this new Label Name property can seamlessly type the name from a particular label control and associate to be more productive.

Introduction of logic of ODBC connection retry

The introduction of ODBC connection retries logic that overcomes one of the drawbacks of MS Access.

Traditionally, in a scenario when there is a loss of ODBC connection in Access with the external data source, users had to first close and then restart their Access databases to start work again, as the users had no options but to close their work and then try to reconnect with the external data source.

But with this new ODBC connection retry logic, Access has the privilege to try and reconnect from a lost connection via the external database, automatically, with smoother user experience while working.

Here is the main path for this reconnection in MS Access:

Once the Access loses ODBC connection from a specific data source, users will instantly see a failure message describing the same.

Now Access tries to reconnect automatically to the external data source based on the operations that depend on it. And on success, users can seamlessly continue to work without any interruptions of closing and restarting Access like before.

And in case this retry process fails, users don't have the privilege to work on objects that depend on external data resources; while you can work on objects that don't require external data resources.

Given that you try to use objects based on external data sources, then Access follows the same reconnection process again until it starts working with the external database for continuity in the working module.

Accessibility improvements

With the newer version of Access 2019, there have been significant accessibility improvements with different aspects of user behavior. The following changes highlight the new and improved Access 2019 for a sleeker experience.

For the Windows Narrator mode and corresponding assistive technology, these changes now improve the accessibility experience and give more power to the user.

- The addition of Lookup fields and Combo boxes in both states of collapsed or expanded is now visible, recognized, and readable to the viewer.
