

This solution has the potential to conduct an effective collaboration between resource management, project management, and portfolio management, so that users can actively track their projects successfully.

Some major features of Microsoft Project 2019

Microsoft Project 2019 is an incredible project management and scheduling tool that allows users to organise, control, and manage defined values. It also helps them manage multiple defined variables, along with managing work and creating realistic schedules to optimise resource usage. Whenever you open a new project, the Quick Access toolbar is visible along with a few Ribbon tabs, Ribbon, and a TimeLine pane with a Sheet and Chart, and a status bar. The major elements of this tool are-

- **Quick Access Toolbar-** It is above and on the left of Ribbon. It is on the screen all the time, and remains in all views.
- **Ribbon Tab-** This feature organises the commands based upon a particular activity. If a user is working with resources, you are more likely to get the settings of commands on the Resource Tab.
- **Ribbon-** The Ribbon offers easy control and access to some of the popular tools and commands. When you change the tabs, the available tools on the same Ribbon also change.
- **Group-** A Group refers to the set of related commands or Ribbon choices. For example, to format the text in a cell, first, it is important to format the information that you have in the group on the Task tab of the Ribbon.
