

Microsoft live events

If you use Microsoft Teams, then you can broadcast webinars, meetings, and live events in your organization to large online audiences. It will be possible for attendees to watch the event live, or recorded in applications like Teams, Yammer, or Microsoft Stream. If you have prior experience of using Skype Meeting broadcast, then you will be comfortable with the live events of Microsoft Teams.

Intelligent BOT framework

You can use the Microsoft Bot Framework to create or personalise your bots. You can personalise your bot with free to use tools present in the Teams App Studio. Through the help of App Studio, it will be possible for you to download, deploy, and submit the bot to the Microsoft Teams for review and possible addition to the store.

You can replace the HTML based FAQ with Bots in Microsoft Teams. Therefore, it is recommended to use Cognitive Services, like the QnAMaker. With QnAMaker.ai, you can train, build, and publish sophisticated bots by making use of product manuals, support websites, editorial content, and SharePoint documents through REST APIs and easy-to-use UI. It is also possible to create a NO CODE bot in Teams, without even writing a single line of code. You can use a pre-built data set and make it to simulate human behaviour.

Limiting emoji usage and renaming channels

Office 365 has brought about useful enhancements such as the usage of emojis at will. It will be possible for you to use any of the Windows Emoji characters in classification labels, Office 365 labels, and even channel names. However, there is an issue with the provisioning engine of SharePoint. Suppose you have two channels with the same name. Under the given circumstances, when you add an emoji to one of them, it will be perfectly ok with Teams but not in SharePoint. Having the same file in both channels can be quite annoying.

Out of the box analytics

The analytics are going to be consistent. However, you may find some
