

has assembled mobile device management. It is difficult to find a software which has the intelligence of protecting itself from ransomware attacks, phishing attempts, and malware. Microsoft Teams has incorporated the best of cybersecurity measures. Apart from two-factor authentication, it supports data encryption in both transit and at rest.

Getting work done quickly with the slash command

This is a short-typed phrase, which is preceded by a backslash resulting in the initiation of specific actions within an app. They are designed for easy and quick activation of everyday functions without the need for hands leaving the keyboard. One of the commonly used slash commands is “/away” that resets your status to away. If you are using a chat, application slash commands will let you join a channel, invite other users, and mark yourself available/busy/away, and offer a high level of personalization.

The new grid view

Navigating through your team has become more convenient with Microsoft Teams. It is possible to see all of your teams in one place, which is inclusive of PLC, class, staff, and other teams. You can draw the attention of a team on selected files and conversation without any visual distraction. It frees you from the worry of files, assignments, and conversations. They will stay where you left them. At your discretion, you can switch back to the old view at any time.

@feature

The proven way to ensure that the recipient receives your message is to use @mention. All it takes is to type @ before the recipient's name, and they will be notified. If there arises a situation where you need to get the attention of the entire team, all you have to do is type @team. You can be sure that everyone in your team receives the notification. If you have a message for all the users in a channel, all you need to do is type @channel before your message. It is up to the team owners to enable the @team and @channel tags.

It will save you time and effort when it comes down to sending individual messages. There is another implication that team owners will have the provision of organizing users based on locations, projects, and roles, thereby ensuring seamless communication. It permits the admin to do more than just adding tags. In Microsoft Teams, admins can authorize who can add tags and how they are used.
